Session10.md 5/15/2020

Session 10 - Two Dimensional arrays - Deep Dive

• In this session we will go through multiple exercises such that we can get used to the concept of 2D-arrays

Class exercises

- 1. Write a C++ program which will replace each element from the main diagonale with the average of its neighbors
- 2. Write a C++ program which will replace the main diagonale with the second diagonale.
- 3. Write a C++ program which will display the elements from a matrix, which are not present on either diagonale (nor main or second).

//TODO => Add sample input/output

- 1. Write a C++ program which will multiply a scalar with a two dimensional matrix
 - The theory says that the result will be a matrix where each element is the element from the first matrix, multiplied with the scalar.
 - o Sample Input:

```
Matrix = 2 9 0
1 3 5
2 4 7
8 1 5
Scalar = 4
```

Sample Output:

```
8 36 0
4 12 20
8 16 28
32 4 20
```

Solution:

Session10.md 5/15/2020

```
int scalar = 4;

for (int i = 0; i < 4; i++) {
    for (int j = 0; j < 3; j++) {
        matrixA[i][j] *= scalar;
    }
}

for (int i = 0; i < 4; i++) {
    for (int j = 0; j < 3; j++) {
        cout << matrixA[i][j] << " ";
    }
    cout << endl;
}</pre>
```

- 2. Write a C++ program to multiply 2-dimensional arrays one by the other. This is also called matrix multiplication.
 - Theory:
 - Make sure that the number of columns in the 1st matrix, equals the number of rows in the
 2nd matrix
 - Multiply the elements of each row of the first matrix by the elements of each column in the second matrix
 - Add the products as follows, considering the matrix from the example:

```
( 3*2 + 2*1 + 1*2 + 5*8) => This will be result[0][0];
( 3*9 + 2*3 + 1*4 + 5*1) => This will be result[0][1];
( 3*0 + 2*5 + 1*7 + 5*5) => This will be result[0][2];
( 9*2 + 1*1 + 3*2 + 0*8) => This will be result[1][0];
( 9*9 + 1*3 + 3*4 + 0*1) => This will be result[1][1];
( 9*0 + 1*5 + 3*7 + 0*5) => This will be result[1][2];
```

- The resulting matrix has M rows X N columns where M is the number of rows of the first matrix and N is the number of columns of the second matrix
- Sample Input:

Sample Output:

```
50 42 42
25 96 26
```

Session10.md 5/15/2020

Solution

```
#include <iostream>
using namespace std;
int main() {
    int matrixA[2][4] = {
        {3,2,1,5},
        {9,1,3,0}
    };
    int matrixB[4][3] = {
        \{2,9,0\},
        \{1,3,5\},
        \{2,4,7\},
        {8,1,5}
    };
    int resultMatrix[2][3];
    for(int i = 0; i < 2; i++) {
        for (int j = 0; j < 3; j++) {
            resultMatrix[i][j] = 0;
            for (int k = 0; k < 4; k++) {
                 resultMatrix[i][j] += matrixA[i][k]* matrixB[k][j];
            }
        }
    }
    for(int i = 0; i < 2; i++){
        for (int j = 0; j < 3; j++) {
            cout<<resultMatrix[i][j] << " ";</pre>
        }
        cout << endl;</pre>
    }
}
```
